

UROLOGIC CANCERS

Some urologic cancers impact both men and women. These are cancers of the bladder, kidneys and adrenal glands. Other urologic cancers such as penile, prostate and testicular only affect men. No matter what kind of urologic cancer one has, it can be scary. The good news is that knowledge is power. Here are a few numbers and percentages to help you stay informed.

18 MILLION

The predicted number of cancer survivors in 2020. This will be 30% more than the number of survivors in 2010.

843

The number of open urologic cancer clinical trials listed on ClinicalTrials.gov as of November 1, 2016. Clinical trials help researchers find new ways to prevent, diagnosis and treat cancer. There are also research studies that explore ways to support caregivers of urologic cancer patients.

77,000

The number of Americans in 2016 who will be told they have **BLADDER CANCER.**

It is the **4TH** most common cancer in men, but it is less common in women.

\$157 BILLION

The cost of cancer care in the year 2010. This large figure was due, in part, to the aging U.S. public. Cancer is more common in older adults.

50%

Percent of bladder cancers contained within the inner layer of the bladder where the cancer is simpler to treat.

1%

The percent of **PENILE CANCER** found in American men. Penile cancer is very rare in North America and Europe.

200

The average yearly number of people in the U.S. who will be told they have adrenal cancer. This cancer is very rare.

64

The average age for someone being told they have **KIDNEY CANCER.** It is not common for kidney cancer to be found in people younger than 45.

15-35

The most common age range for testicular cancer to be found. Testicular cancer is found mainly in younger men. Because treatment for testicular cancer is so successful, the 5-year relative survival rate is 99% when the cancer is localized. This means that the cancer is still contained within the testicle.

11,990

The number of practicing urologists in the U.S. The states with the highest number of practicing urologists are California, Florida, Illinois, New York, Ohio, Pennsylvania and Texas.

1 IN 7

A man's lifetime risk for being told that he has **PROSTATE CANCER.**

PROSTATE CANCER IS THE No. 1

cancer risk for men, as well as the No. 2 cancer killer (behind lung cancer).

98%

The 10-year relative survival rate for prostate cancer, when caught early.
